SECTION 3 DIT PROGRAM AREAS

3.0 TECHNOLOGY FOCUS BY PROGRAM AREAS

The Department of Information Technology (DIT) portfolio is internally structured by Program Areas. These Program Areas are business domain driven catering to groupings of related County agencies, and comprise a logical cluster of projects under them. Implementation of these projects are key to enduring each Program Area is realizing stated DIT Strategic Goals and in turn enabling the overall Countywide Strategy. The following sections provide an overview of DIT's Program Areas.

3.1 DIGITAL GOVERNMENT/E-GOVERNMENT

The Digital Government (E-Government) initiative supports the county's vision of a government "without walls, doors, or clocks," by delivering modern, accessible, and transparent services. It advances the county's strategic goal of an effective and efficient government integrating digital platforms across public and internal domains to streamline service delivery, promote engagement, and enhance operational efficiency. The core objectives are to:

- ✓ Deliver convenient, mobile-first, user-centric, data-driven services.
- ✓ Ensure transparency and engagement through open data and analytics.
- ✓ Promote accessibility and inclusion through multilingual tools and ADA compliance.
- ✓ Support mobility, emergency readiness and remote access.
- ✓ Strengthen cybersecurity and privacy protections in digital service delivery.
- ✓ Adopt cloud-native, containerized services and shared platforms as appropriate.

The E-Government program supports over 55 county agencies by providing a comprehensive digital infrastructure that includes the public website (<https://www.fairfaxcounty.gov>), intranet services, mobile applications, social media platforms and Interactive Voice Response (IVR) systems. It also encompasses Customer Relationship Management (CRM) tools and supports the underlying Web Content Management (WCM) architecture, web infrastructure, and application framework needed to deliver and maintain these services effectively.

DIT PROGRAM AREAS

The overall digital government program supports Board priorities regarding public engagement, and other County initiatives associated with technology innovation in public service including, land use, Next Generation 9-1-1, and Health and Human Services Integration Initiatives.

The Department of Information Technology (DIT) and Office of Public Affairs jointly oversee the design, digital content, navigation, and social media integration aspects of the county website.

Fairfax County Website

Fairfax County has consistently received national recognition from the Center for Digital Government as one of the top-ranking localities in the US, placing in the **top ten** for the past sixteen years.

The E-Gov program continues to work with the Commonwealth of Virginia, regional partner municipalities, and federal government agencies in interoperability of common service portals and developing web service standards to enable cooperative access and seamless integration of information and services regardless of the origin or the source.

WEB PRESENCE

Fairfax County's award-winning website embraces a mobile-first, responsive design. With machine translation and accessibility compliance (Section 508 & ADA), the site supports:

- ✓ Over 85 agency and topic multisites.
- ✓ AI-powered bilingual chatbot (Fairfax Virtual Assistant) with 44K+ sessions.
- ✓ "Live Chat" support during business hours based on specific agency needs.
- ✓ Hundreds of transactional services (e.g., permits, tax payments, job applications).
- ✓ Interactive dashboards enhance data transparency and engagement which include real-time visualizations.
- ✓ Central NewsCenter portal consolidating press releases and news updates.
- ✓ Newsletter subscription via the county's electronic outreach platform reached 76K subscribers, with 1.3K newsletters distributed.
- ✓ Emergency alert subscriptions are available via email and text.

SMARTPHONE NATIVE APP

Mobile enhancements reflect the County's commitment to accessibility and 24/7 service delivery:

- ✓ Official Fairfax County App offers news, alerts, GPS maps, service directories, and emergency information.
- ✓ Over 7,000 app downloads with 850+ active push notifications.
- ✓ Supports field staff with secure, real-time access to systems and data.
- ✓ Continued development of mobile-first services and cloud-native applications.

SOCIAL OUTREACH

Social media is a cornerstone for community engagement, enabling two-way communication:

- ✓ 28+ Facebook pages, including multilingual accounts (e.g., Korean and Spanish).
- ✓ 18 X.com feeds (formerly Twitter) reaching 38M users in FY 2024.
- ✓ 439K+ verified Nextdoor users.
- ✓ Real-time updates, community engagement and emergency communication.
- ✓ Centralized publishing and analytics tools for engagement success.

The County continues expanding its multilingual and cross-platform presence to strengthen public outreach and collaboration.

KEY METRICS: FY 2020 - FY 2024

Channel	FY 2020	FY 2021	FY 2022	FY 2023	FY 2024
Website Page Views	62M	89M	66M	54M	46M
Facebook Reach	95M	61M	76M	59M	58M
LinkedIn	467K	889K	927K	898K	1.4M
YouTube Views	763K	623K	709K	283K	1.7M
Nextdoor Users	272K	335K	366K	390K	439K
Twitter/X Reach	75M	67M	51M	48M	38M

Table 1 - Number of visits, views, impressions made with Fairfax County's social media.

AUDIO AND VIDEO

Podcasts and video are leveraged to extend accessibility and public connection:

- ✓ Podcasts in English and Spanish for diverse participation cover government updates and community priorities.
- ✓ YouTube is used for public meetings, board hearings and announcements.
- ✓ Cable TV and streaming services support remote participation and transparency.

HIGHLIGHTS AND ACCOMPLISHMENTS FROM FY 2025

- ✓ Successfully implementing Siteimprove, a cloud-based tool that supports accessibility, readability, SEO, and ongoing website maintenance, to meet DOJ accessibility requirements and improve user access.

DIT PROGRAM AREAS

- ✓ Migrating deprecated field collections to paragraph types in preparation for upgrading the Web Content Management System from Drupal 8 to 10. The upgrade ensures compatibility, streamlines future platform enhancements and lays a foundation for scalability, usability and long-term maintainability.
- ✓ Introducing an online registration module within Web Content Management System, for county events, enabling residents to sign up, reserve spots, receive event notifications and manage their reservations.
- ✓ Continuously enhancing the public website to improve performance, optimize user experience, and increase public engagement through more accessible services.
- ✓ Launching Fairfax Web Metrics dashboards by leveraging existing Google Analytics integration on the county website, resulting in over 90 Power BI dashboards. These dashboards provide staff with actionable insights to support transparency and data-driven content decisions.
- ✓ On FairfaxNET, the county's intranet built on SharePoint Online, migrating over 650 Nintex Workflows for O365 to Nintex Automation Cloud (NAC) in response to Microsoft's upcoming end-of-support. This protects continuity of operations and maintains workflow efficiency across county departments.

PLANNED DELIVERABLES FOR FY 2026

- Enhance AI capabilities – Smarter, multilingual GenAI virtual assistants and potential integration with home assistant devices.
- Focus on personalized, user-based experiences – Improved user interfaces based on behavior, needs, and preferences.
- Expand cloud-native development – increase adoption of containerized, scalable application platforms and shared service solutions.
- Cross-jurisdictional integration – Enhanced collaboration with regional, state, and federal partners.
- Continuous innovation – Prioritize improved service delivery by ongoing assessment of trends and emerging technologies.

Through these efforts, the County remains committed to transparent, inclusive, and responsive digital government.

3.2 GEOGRAPHIC INFORMATION SYSTEMS

Geographic Information Systems (GIS) is a strategic foundational technology, integrated with numerous County applications and business processes. GIS data and systems remain essential components of County operations and are heavily used by a wide range of County agencies for a variety of business purposes. The GIS Division maintains a state-of-the-art enterprise-scale GIS system with a range of technologies, related products, and data that provide the platform for ongoing integration of GIS into County operations as well as enabling the agencies to maximize the use of analytical GIS in their lines of business.

With the county GIS modernization program, the technology has been transformed into a platform for all workers in nearly all lines of business and is no longer mainly used by specialists. Web-based GIS applications have bridged this gap and continue to be central to communicating locational based information to staff and residents. These map-centric applications continued to be created by County staff for operations and the public in FY 2025. Many of these are featured in the entries for the annual GIS Excellence Exhibition. GIS Excellence Gallery 2024 (arcgis.com) ([GIS Excellence Gallery 2024](#))

In FY 2025, the county saw the continued trend of expanded and heightened utilization of the internal Enterprise Portal as well as the Police and Fire and Rescue internal portals. These platforms have become hubs for internal applications that support many different groups in day-to-day operations. The coming fiscal year will see the deployment of additional agency portals to

support Health Department operations and a Public Works asset management system deployment. These deployments provide HIPPA compliant space and system isolation for operational assurance.

The GIS program maintains many key county GIS layers and is integral to land development processes. Parcels, zoning districts, street centerlines, planimetrics, addresses and many others are maintained by the division. All parcel map changes are posted daily, providing web users of the Digital Map Viewer (DMV) and other applications with the latest versions of the maps. On average, over 13,000 DMV maps are viewed or downloaded per month.

Access to accurate street centerline data is particularly important to the Fire and Rescue personnel who may have to cross jurisdictional boundary lines when responding to an incident. The GIS Division maintains Fairfax County's Street centerline data used in the CAD/911 system and provides the data to the Commonwealth of Virginia which aggregates into a state-wide centerline file.

GIS support for the CAD/911 system is a core GIS Divisional responsibility involving data maintenance requirements that continue to represent a significant effort for the office. With the transition to Next Generation 9-1-1, regional oriented street data plays an even more critical role.

Working towards improved government interoperability is a significant and ongoing strategic activity for the GIS Division, both within Northern Virginia and regionally through the Washington Metropolitan Council of Governments (MWCOG). Interoperability across the National Capital Region (NCR) and with the Federal Government for emergency response purposes is crucial. Fairfax County is a member of the COG GIS Executive Committee and has guided the development and implementation of the regionally funded National Capital Region Geospatial Data Exchange (NCR GDX) through operational Program Management and Direction.

In addition to hosting the platform, providing guidance, governance, consultation, interoperability capabilities, and various services, the GIS Program procures and acquires common data assets as part of annual programs. These data sets benefit a multitude of agencies and are acquired through Technology fund requests annually on behalf of all parties.

The most widely used dataset resulting from these programs has been produced by the annual aerial photography programs. The county flies its program from December until March as necessary to capture cloud and snow free leaf off imagery. This imagery is both oblique (side looking) and orthographic (from vertically above). This imagery provides vivid intelligence regarding existing conditions to the 911 center, planners, engineers, decision makers and the public. The next flight is scheduled to begin in December 2025.

The aerial imagery program is also used as the source for the county's planimetric data capture program. Planimetric data is another foundational data set for almost all County GIS applications. Planimetric data is information derived from aerial imagery that model natural and man-made visible features. Accurate planimetric data depends on the high resolution and high accuracy ortho-imagery which the county now acquires yearly. In 2024, the county completed an update from the year 2017 to 2023. The County is pursuing a planimetric update schedule to meet the business needs that were identified across the county. As a result, the County will undertake an annual update cycle in 2025.

The annual aerial imagery is leveraged to produce 3D photo mesh products as well. A photo mesh is a seamless photo realistic 3D model of natural and built features that can be used in 3D interactive applications. The Department of Planning and

DIT PROGRAM AREAS

Oblique example of building

Orthographic example of same building

Development is piloting the use of this data for showing proposed developments in their existing environment and for public future public outreach. Recent supervisor town hall events used 3D flythroughs to take the public on a tour of changes in the district. An updated dataset will be received in summer 2025.

Surface information is crucial to many environmental regulatory and stewardship functions undertaken by the County. The GIS Division leads the region in these areas, with exploitation of LiDAR and Land Cover Analysis. In 2015, for the first time, the County obtained LiDAR (Light Detection and Ranging) data for the entire County. A second LiDAR capture was performed again in 2018, and another flight was conducted in late 2022 and was delivered in 2024.

Acquired in partnership with the US Geological Survey, this newest collection is at 8 points per meter totaling forty-six billion data points and over 1 TB of data. The resulting detail above ground and the ground level provides high value capabilities while the year-to-year comparisons now possible give unprecedented insight into how conditions change on distressed streams and other areas.

3D photo mesh example 1.

Image used in town hall presentation Winter 2025.

Elevation data used with 3D models to simulate flooding that consequences accurately.

Access to the GIS data and ways for the public to use have been a focus of the GIS Division. The public Interactive Map Gallery is the hub for all online maps on the County web site though each appears embedded on the relevant agency business webpages as well. The Interactive Map Gallery alone hosts over eighty applications that provide a variety of informational and interactive services. Most Interactive Map Gallery ([Fairfax County Interactive Map Gallery](#)) applications are focused and thematic, but the public also has access to a general GIS viewer and reporting application. The JADE ([Fairfax County Jade](#)) was originally developed in FY 2020 as a public facing light GIS that allows residents to work with the GIS layers independent of thematic applications. The internal facing Geographic Exploration and Mapping (GEM), a sister application, contains largely the same information, with both applications providing residents and County staff easy access to GIS information that staff will use in assessments and reviews. Online training videos support the public in learning how to use the JADE application and the use of both applications fill an important open government niche. In FY 2024, the GEM and JADE applications received updates for further improvements. In 2025, the JADE hardware platform will be reconfigured to better support the needs of the public.

Fairfax County is a member of the Northern Virginia GIS managers group, an informal group that regularly meets to coordinate activities, serves on the MWCOG GIS Committee, and works closely with the State's GIS agency (Virginia Geographic Information Network), which is part of Virginia Integrated Services Program. Additionally, each year, GIS hosts "GIS Day" every November and the GIS Excellence Gallery which promotes the use of GIS and development of new GIS applications through, an agency showcase event in November.

HIGHLIGHTS AND ACCOMPLISHMENTS FROM FY 2025

- ✓ The GIS Division completed a county wide planimetric mapping update program in FY 2025, bringing county map resources up to date and into a yearly cycle to keep this asset more current.
- ✓ Provided high quality aerial photography for a variety of county business uses and on a trial basis for FY 25, began multiple flights per year.
- ✓ Completed the county wide LiDAR project and integrated updated terrain data in applications and data sources.

DIT PROGRAM AREAS

- ✓ Put a new transportation data model into production with more automation to support accuracy and efficiency of 911 location data maintenance.
- ✓ Developed updated 3D models of Fairfax County and deployed them for agency use in land development business areas.
- ✓ Improved regional address datasets for regional address search support to improve county services especially in areas of unified services.
- ✓ Created and deployed a new county facility data model to track all county facility locations across multiple departments serving all purposes with a common dataset, tool and model.

PLANNED DELIVERABLES FOR FY 2026

- Continue to provide a state-of-the-art, stable and capable enterprise GIS platform to support county business needs for locational intelligence.
- Complete a new demographic forecasting tool to provide a modern system for sub-county level population forecasts used in a variety of county reports and documents.
- Capture leaf-off aerial photography in proper flight windows to support the 911 system, and a variety of county purposes.
- Begin an annual update cycle for planimetric data to keep county mapping assets up to date.
- Support county agencies in applying GIS to new areas of their business.

3.3 HEALTH AND HUMAN SERVICES TECHNOLOGY SOLUTIONS

The Department of Information Technology's (DIT) Health and Human Services (HHS) program provides comprehensive technical support and innovative IT solutions to enhance the delivery of essential human services throughout the County. By prioritizing modernized infrastructure and secure data practices, this program plays a pivotal role in ensuring that HHS agencies and their collaborative partners can operate efficiently and respond effectively to community needs.

This section offers an in-depth look at the scope of work provided by the DIT HHS program team. It outlines the supported agencies, describes the technical and operational services rendered, and highlights key modernization initiatives aimed at improving efficiency of HHS agency staff and service delivery for the residents of Fairfax County.

The DIT HHS program supports five primary agencies within the Health and Human Services cluster:

- **Department of Family Services**
- **Health Department**
- **Community Services Board/Regional Community Services Board**
- **Neighborhood and Community Services**
- **Housing and Community Development**

In addition, the team extends its expertise to other County agencies whose operations align with or complement HHS programs, including:

- **Department of Transportation:** Primarily supporting paratransit programs.

- **Department of Procurement & Material Management (DPMM):** Offering specialized support for grants management applications.
- **Juvenile & Domestic Relations District Court (JDRDC):** Coordination on matters related to juvenile health and human services.
- **HHS Partnerships with Parks and Schools:** Fostering community service initiatives through collaborative projects.

The DIT HHS program team plays a multifaceted role in ensuring that both new systems and existing applications are secure, efficient, and integrated with County-wide IT standards. Currently, HHS agencies are moving away from legacy applications on older platforms to implement solutions that improve information security, the quality and availability of analytical data, and improved workflow to promote operational efficiency in their human service program operations. The DIT HHS team maintains the legacy applications while working with agency customers to implement modernized solutions. Key responsibilities include:

- **Technical Guidance and Coordination:** Working in partnership with County agency technical and business staff, the DIT HHS team provides essential guidance and coordinates efforts with DIT infrastructure and enterprise systems teams to facilitate HHS agency technology improvements.
- **Application Development and Maintenance:** The DIT HHS team develops and maintains custom solutions and integrations to address HHS agency business requirements. Additionally, the team performs system and platform upgrades required to maintain compliance with County IT standards. For systems already in operation, the team offers continuous support by troubleshooting issues, responding to enhancement requests, and monitoring compliance with current standards for information security, operating systems, network stability, and database management.
- **New Technology Implementations:** Working with HHS agency business and IT specialists, the team oversees transitions from legacy systems, participating in the requirements development and product evaluation and selection processes to ensure product vendors meet the agency-specific and County IT requirements for custom or commercial off-the-shelf (COTS) products. DIT HHS team members also work with vendors delivering solutions to ensure they comply with County IT standards from the solution planning and design process through delivery and acceptance.

Recognizing the need for robust IT systems to support human services, HHS agencies are investing in several key areas:

- **Electronic Health Records (EHR):** The move toward modern EHR systems is designed to enhance information security and improve the quality and accessibility of patient data. Modernized EHR solutions facilitate interoperability between agencies, fostering a more holistic approach to patient care and ensuring seamless data sharing with external partners.
- **Call Center and Multi-Channel Telecommunications:** Upgraded telecommunications solutions enable more responsive and efficient service delivery. By investing in advanced call centers and multi-channel support systems, agencies can ensure that individuals in need are promptly connected with the appropriate resources and support services.
- **Case Management Integrated with Business Intelligence and Analytics:** Advanced case management systems now incorporate document management, content management, and integrated analytics tools. This comprehensive approach enables data-driven decision-making, improves workflow efficiency, and supports the complex reporting requirements of human service programs.
- **Learning Management Systems (LMS):** To address challenges such as high staff turnover and the loss of institutional knowledge from staff retirements, modern LMS platforms offer flexible, accessible training solutions. These systems support workforce optimization by providing adaptable curricula, multiple delivery methods, and efficient content development, ensuring that staff remain well-equipped to meet evolving program demands.

The shift from outdated legacy systems to modern platforms reflects a proactive effort to improve operational efficiency, bolster data security, and enable timely responses for community members who rely on HHS services.

DIT PROGRAM AREAS

The comprehensive efforts undertaken by the DIT HHS program showcase a decisive commitment to modernizing IT infrastructure and supporting the vital human services that benefit Fairfax County residents.

HIGHLIGHTS AND ACCOMPLISHMENTS FROM FY 2025

- ✓ Successfully migrated 20+ business-critical applications to SQL Server 2022, improving performance, scalability, and long-term support readiness.
- ✓ Migrated legacy enterprise application from Oracle to SQL Server 2022, and to SSRS 2022, streamlining data operations and reducing licensing and maintenance overhead.
- ✓ NCS Avaya to CISCO Implementation: Team collaborated with DIT Telecom, CISCO teams and NCS users to aid rollout. This included generating user guides, reference documents, train the trainers, and providing in-person support at multiple locations.
- ✓ Major Product Releases and Enhancements: Enhanced core business processes across multiple applications by delivering a range of new features, improving efficiency, user experience, and operational effectiveness.
 - ◆ NCS FairFACS Phase II Implementation
 - ◆ DFS HHSIMS Finance and enhancements completion of Phase I (Outstanding Performance Team Excellence Award Winner)
 - ◆ DFS ECMS Enhancements and Reporting
 - ◆ Regional CSB DAPS Enhancements

PLANNED DELIVERABLES FOR FY 2026

- HHS IMS Completion: DFS' Integrated Management solution will be completed in the first half of FY 2026 with the completion of the remaining functionality and enhancements supporting process and financial requirements.
- CRTS WebR Transition: HHS team will support DPMM's transition of the legacy application used to manage the Consolidated Community Funding Pool (CCFP) program management transfer to a COTS solution to be identified by DPMM.
- NCS CCMS LMS: Delivery of learning management solution.
- DFS MARS Power apps solution delivery.
- Support of HHS agency call center transitions in early FY 2026.
- Tasks supporting legacy modernization and ensuring system compliance with DIT standards.
- Continued support of Athletic Field Scheduling System and Consolidated Registrations sourcing and selection processes.
- Maintenance and support for existing applications.

3.4 PUBLIC SAFETY SYSTEM AND SERVICES

The Public Safety Division within DIT is comprised of two distinct branches: Public Safety Applications Branch (PSB) and the Radio/Wireless Services Branch (RSC). The Public Safety Division has direct responsibility for providing applications and communications support to the Fairfax County Fire and Rescue and Police Departments, the Department of Emergency Management and Security, the Department of Public Safety Communications, and the Fairfax County Sheriff's Office. In addition, the PSB has recently begun providing support to the Department of Vehicle Services and the RSC also supports the Fairfax City Fire and Rescue Department as well as the Police Departments for Fairfax City, and the Herndon and Vienna Police Departments, George Mason University Police Department, and their respective dispatch centers for radio communications.

In 2023, it was determined that the RSC would be transitioned under the umbrella of Public Safety from the Technology Infrastructure Division since the program's primary customers are the Public Safety agencies.

The PSB currently has 33 discrete applications it currently provides support for and another in development. Additionally, the PSB team is supporting the transition of several of the Sheriff's Office applications to new platforms. The Sheriff's Inmate Management System, developed by PSB and has been in use for over 15 years is being transitioned to a new Jail Management System (JMS), a COTS product cloud-based solution that will have additional functionality utilizing the newest technologies. The new JMS will meet the demands of managing a population of approximately 1,200 inmates housed within the Fairfax County Adult Detention Center by supporting booking receiving and release, classifications, complex sentencing calculations, incident reporting, inmate records, medical, behavioral health, finance, property, programs, professional services, transportation, and visiting. The system will provide accurate reporting and statistics required for the Sheriff's Office to remain in compliance with local, Virginia State Code, Supreme Court of Virginia Statutes, and Federal and State data and reporting mandates.

The system will interface with electronic medical records, inmate accounting, commissary, inmate communications, mugshots, scanning, Police Department (PD) Records Management System (RMS), and the Sheriff's Records Management System (RMS) for incident-based reporting (IBRs), as well as multiple state and local systems such as Active Directory, Local Inmate Data System (LIDS), Northern Virginia Regional Information System (NOVARIS), Virginia Criminal Information Network/ National Crime Information Center (VCIN/NCIC), and Victim Information and Notification Everyday (VINE). The new system will provide the opportunity to automate remaining manual tasks, provide robust reporting and statistics, automate notifications and alerts, provide a mobile solution, and interface with the Fairfax County Courts (Circuit Court & Records, General District Court, and Juvenile & Domestic Relations District Court) and the Magistrate's Office.

As this project is in transition, the Medical Section of the Adult Detention Center (ADC) has selected a new Electronic Health Record System to replace the existing solution. Both transitions will have a significant impact on the way the Sheriff's Office manages the operations of the ADC and the people that are under the care of the Sheriff's Office while in custody. Other such applications that help to support improved outcomes of people housed in the ADC, and that have interactions with law enforcement or are involved with the criminal justice system under the Diversion First umbrella include: Diversion First Data Warehouse, Crisis Intervention Team dashboard with Power BI reports, Merrifield Crisis Response Center Data Sheet, Co-Responder Model for Emergency Crisis Services, National Institute on Drug Abuse (NIDA) Assist under the Jail Based Behavioral Services program, Community Response Team Dashboard with Power BI reports, and the Court Services Pre-Trial application that assists in a number of program efficiencies for the court system.

DIT PROGRAM AREAS

The Sheriff's Office is required by Virginia Code 8.01-293 to execute civil processes within its jurisdiction, and to report statistics as required by the Virginia Compensation Board. The Office of the Sheriff, in collaboration with the three Fairfax County Courts, and the Department of Information Technology is implementing an Advanced Civil Enforcement System (ACES) to automate existing civil enforcement business processes and replace the legacy systems. The ACES solution provides a web and mobile solution, enhanced security, reporting, statistics, and will also provide interfaces between the Sheriff's Office, the Courts, and other County agencies. The ACES Project Sheriff Civil Enforcement System has transitioned to a new, internally built Civil Enforcement System called NuACES supporting critical needs of the Sheriff's Office Civil Enforcement Branch. This includes the civil enforcement processes such as real-time tracking of service information, a single bi-directional interface with the General District Court's Case Management System (CMS), an interface with the County's Geographical Information Systems (GIS) for geocoding and geofencing to electronically track service documents, and a mobile solution utilizing existing infrastructure.

The Fairfax County Sheriff's Office is an integral part of the cross-system Diversion First initiative. Diversion First is a cross-system initiative that offers alternatives to arrest and incarceration for people with mental illness, substance use disorders, and/or developmental disabilities who encounter the criminal justice system for low-level offenses. The goal is to intervene whenever possible to provide assessment, treatment, or needed support, to prevent repeated encounters with the criminal justice system and promote a safer community with enhanced public safety. Diversion First is a collaborative effort involving health and human services, public safety, and the courts. This project supports implementation of a technology solution to standardize and automate data capture, analysis, and reporting, to ensure accuracy of the data, and significantly improve turn-around times for reporting and outcomes analysis. This will ultimately result in enhanced public safety, a healthier community, and a more cost effective and efficient use of public funding.

The Fairfax County Police Department is also in the process of implementing a Real-Time Crime Center (RTCC) and will be used to solve crimes, enhance officer safety, provide visibility to emergency events, and better inform our department about ongoing criminal trends. RTCC's use software integration systems to combine technology and data sources used by staff at the RTCC. A growing list of video, license plate reader, covert and overt camera systems, as well as body worn and in car video, create multiple interfaces that must be navigated during an event. A software integration system would bring all those interfaces, including data sources, into a single viewing platform that will allow for quicker access when dealing with in-progress events.

The current Police Department Records Management System (iLEADS) was replaced with a next-generation Records Management System (RMS). The new RMS provides the Police Department with a commercial off-the-shelf web-based solution that will integrate with third party software and integrate closely with the current version of the Computer Aided Dispatch (CAD). The new system will fully utilize and support the present and future needs and business processes of the police department. The new RMS will incorporate legacy information from the existing Police Department data warehouse seamlessly with the ability to present, analyze, search, and collate data for custom reporting useful in crime analysis and staffing needs. This more modern

system also assures improved accuracy, timeliness, reliability, and accessibility of information on events.

The existing 911 Emergency call handling system utilized by the Department of Public Safety Communications to take 911 emergency calls has reached end-of-life after seven years and the implementation of a new cloud-based call handling system will be completed in CY 2024. Three of the five locations have been upgraded to the new call platform with the remainder planned for completion by July 2024. The cloud-based solution provides multiple layers of geographic redundancy, simplifies maintenance at the local level due to the cloud architecture, and improves ease of integration with other cloud-based public safety applications. Key new features include automatic two-way language translation (up to 170 languages) and transcription of voice and text call, ability to receive inbound video for emergent situations, improved mapping, and ability to display relevant public safety data (Virginia Department of Transportation - VDOT camera feeds, vertical location information for callers, floor plans, etc.). The cloud-based platform establishes the potential for greater regional interoperability using a shared platform.

Project efforts are underway to allow machine learning capabilities to support dealing with critical staffing shortages by performing triage of non-emergency calls using advanced software services (voice chat, text links to online web resources, etc.). This allows citizens to directly reach sources of information, if desired, without the need to speak to public safety telecommunicators. Other planned efforts include allowing near real-time transcription of radio transmissions for police and fire dispatchers to enhance officer safety and allow for keyword alerts such as officer down, mayday, etc. and additional integration of data sources to improve response times and to allow integration of 911 data with County Command Centers in real-time.

Fairfax County has managed a grant for a US Department of Homeland Security Urban Area Security Initiative (UASI) program since 2008 that provides for interoperability between Computer-Aided Dispatch systems from the Washington, DC Metropolitan Council of Governments (COG) jurisdictions, which currently includes 24 local governments, Washington, DC, the states of Maryland and Virginia, and agencies from the US Federal Government. There are currently eight actively participating jurisdictions with three more jurisdictions in the schedule for implementation that are actively being integrated. There are another three other jurisdictions in the planning process to join the CAD2CAD environment. The

CAD2CAD solution allows member jurisdictions the ability to dispatch Fire and Rescue units to mutual aid incidents without directly contacting the jurisdiction providing the available requested resource. Prior to the genesis of the CAD2CAD program, jurisdictions would have to physically call the neighboring 911 centers to request units to be dispatched to an incident, thus delaying the response of critical emergency resources. On average, the CAD2CAD solution reduces dispatch times by an average of 90 seconds, which on face does not appear to be much, but when coupled with other technological and communications enhancements, first responders are arriving on the scene of incidents much faster and safer, thus can mitigate emergencies in a much shorter time

frame. The CAD2CAD program is currently in the process of testing the new Next Generation Exchange (NGX) interface with Fairfax County, Washington, D.C., and Anne Arundel County, MD. Upon completion of testing, all current member jurisdictions utilizing CAD2CAD will transition to utilizing the NGX interface along with all future agencies. There are also planning efforts to incorporate law enforcement agencies into CAD2CAD service.

Identification, location, and mitigation efforts of radio interference that negatively impacts the radio system through real-time monitoring is a responsibility of the RSC Engineering team as well as Distributed Antenna System plans review, site walks, commissioning, and assessments for buildings that wish to retransmit public safety spectrum that will assist first responder communications in times of emergencies. Annual coverage testing of the County, coverage map creation, and coverage analysis is also performed by RSC personnel.

In addition to maintaining and operating the Public Safety LMR system, the RSC also provides frequency management and coordination of County licensed radio spectrum from the Federal Communications Commission (FCC) and works with regional, state, federal (civilian and DoD) partner jurisdictions and agencies to facilitate and maintain communications interoperability within the Washington, DC National Capital Region (NCR).

RSC staff is also responsible for the design and installation of radio and data communications equipment, In-Car-Video (ICV) solutions, and other electronic peripherals in public safety vehicles. Whether the vehicle is marked and readily identifiable, unmarked, or covert, RSC technicians perform installation and repair services that comply with industry standards and in such a manner that allows public safety personnel to perform their duties while having the necessary equipment easily and safely within reach.

HIGHLIGHTS AND ACCOMPLISHMENTS FROM FY 2025

- ✓ Real Time Crime Center (RTCC) begins operations with equipment and staffing. Systems purchased, installed and camera/system integrations initiated.
- ✓ PD Records Management System (RMS) successful go-live occurred May 2025 replacing legacy iLEADS system.
- ✓ RSC will be on pace to build out 259 vehicles ranging from sedans to pickup trucks, sport utility, and specialty vehicles
- ✓ Planned upgrades of the 911 Emergency call handling system to Vesta NXT

PLANNED DELIVERABLES FOR FY 2026

- RTCC Community and business engagement sessions for camera integration, and RTCC basic integration with RMS.
- RTCC refinement and establishment of final protocols and evaluation of operating system
- RSC estimated to build out 265 vehicles and related installations
- Continued development of ACES project to provide secure public and internal web access, bi-directional interfaces between ACES and the three Courts' case management and imaging systems, and interfaces with other County agencies
- Support transition of Sheriff's Office applications to new platforms including JMS, and RMS.

3.5 REVENUE SERVICES

The County's tax system applications play a vital role in revenue collection, financial management, and providing essential services to its residents. Leveraging advanced technology and innovative approaches, Fairfax County has developed a comprehensive suite of tax system applications to streamline processes, enhance transparency, and ensure compliance with tax regulations. Fairfax County Tax System Applications are broken down into several areas:

Property Tax Management Systems: This includes the COTS solution, Tyler Technologies, Enterprise Assessment and Tax System (Real Estate), and the in-house built Tax and Business Solution (TABS). These systems are the cornerstone of Fairfax County's tax infrastructure. They facilitate assessment, billing, and collection of property taxes, which constitute a significant portion of the county's revenue. The in-house developed solution TABS manages multiple tax types, including:

- Personal Property
- Business Personal Property
- Business, Professional and Occupational License (BPOL)
- Short Term Rental
- Transient Occupancy Tax

Web and Payment solutions: To facilitate seamless transactions, Fairfax County provides an online payment gateway that supports various tax payments, including property taxes, business taxes, and vehicle taxes. These solutions are offered in two forms- Stand Alone and via MyFairfax Portal. Stand Alone allows for one-time transactions for quick and easy payments. The MyFairfax Portal allows taxpayers to create an account and link to the Tax Application. Once linked taxpayers can track and maintain their personal tax history with Fairfax County for both Real Estate and Personal Property tax. This secure and user-friendly platform allows taxpayers to make payments using different methods, such as credit/debit cards or electronic funds transfer, thereby promoting financial inclusivity and ease of payment. Additionally, vehicle tax registrations and taxation are streamlined through Fairfax County's dedicated systems. This platform enables residents to register their vehicles with the county for tax purposes, update and change registrations. By digitizing these processes, the county enhances convenience for taxpayers while ensuring accurate and timely collection of vehicle-related taxes.

Fairfax County's Business, Professional and Occupational License Portal caters to the needs of businesses operating within the county. From business license renewals to tax filings, this portal offers a centralized platform for business owners to fulfill their BPOL obligations efficiently. It simplifies the process of registering new businesses, updating information, and calculating taxes, thereby fostering a conducive environment for economic growth.

In addition to its tax system applications, Fairfax County emphasizes taxpayer assistance. The in-house developed Tax Relief solution allows the Department of Tax Administration to assist eligible residents to apply, track and disburse tax relief and rental grant relief. A new streamlined, integrated solution has been deployed to better serve both residents and staff. This new system is based on a digital forward approach, removing the need for retaining hard copies of documents. This allows for quicker review and processing of Tax Relief requests.

Additional projects are underway to install personal property payment kiosks around the county. This will allow for after-hours and weekend payment collection in various tender types without having to come to the main office. Within the operational area,

new customer relation management systems have been developed to better assist residents in a more efficient and effective way. Along with the new customer relation management system, the telecommunications solutions have been revamped and modernized. The goal of the tax systems is to provide a more diverse base of systems and solutions to create better customer experience and make the collection and distribution of taxes more efficient and effective, while keeping equity and accessibility a priority.

HIGHLIGHTS AND ACCOMPLISHMENTS FROM FY 2025

- ✓ Successful move of the onsite Tyler CAMA solution to the Cloud PaaS solution
- ✓ Transition the existing SAS environment for Unix to Linux, updating the core and forward-facing application
- ✓ Updated and upgraded the core functionality of MyFairfax to increase capacities and capabilities
- ✓ Implementation of Twilio for call services for DTA

PLANNED DELIVERABLES FOR FY 2026

- Deliver Tax Diversification project – Food and Beverage, Transient Occupancy Tax
- Implement four Kiosks throughout the County for more accessible payment of Personal Property Tax
- Move the current Personal Property Tax solution (TABS World and its externally facing components to the Oracle Cloud Environment

3.6 CYBERSECURITY PROGRAM

The Information Security Office is responsible for developing and enforcing the cybersecurity and data security policies that protect the County's critical information and technology infrastructure. The County's cybersecurity program integrates industry best practices, modern technologies, and private sector partnerships to mitigate evolving cyber threats, enhance resilience, and maintain trust in the County's technology systems and services.

The primary objectives of the cybersecurity program are to ensure confidentiality, integrity, and availability of data and systems, while also ensuring compliance with key legal mandates such as HIPAA, PCI-DSS, and CJIS. This program safeguards sensitive information and protects the critical infrastructure essential for delivering citizen services, ensuring public safety, and maintaining operational continuity.

The program employs a comprehensive, defense-in-depth strategy to achieve these goals, encompassing the following key areas:

- Risk Assessment and Threat Analysis
- Policy and Standard Development and Enforcement
- Vendor and Service Provider Management
- Identity Management and Access Control
- Data Protection and Loss Prevention
- Network Security
- Endpoint Security and Configuration Management

- Incident Response and Contingency Planning
- Training and Awareness
- Continuous Monitoring and Threat Detection
- Compliance and Regulatory Adherence

Ongoing initiatives focus on enhancing resilience, business continuity, and incident preparedness as the County transitions to a hybrid multi-cloud infrastructure. This transition ensures secure and reliable application and service delivery. These efforts will also align the County more closely with federal and state cybersecurity regulations, while addressing the growing body of legislation on cybersecurity, data privacy, and sharing across the public sector.

Fairfax County's cybersecurity program is nationally recognized as a model of innovation, collaboration, and impact in the public sector. Under the leadership of the Department of Information Technology's Information Security Office, the County has received numerous prestigious honors for its enterprise-wide cybersecurity strategy and program execution.

Key awards include the **2025 Top 25 Doers, Dreamers & Drivers Award** from Government Technology Magazine, and numerous awards over the past decade that reflect the County's commitment to protecting systems and resident data through collaborative, innovative approaches.

Fairfax County has also been recognized through several high-profile nominations, including finalist status in the **2025 Capital ORBIE Awards** (Public Sector category), a nomination for the **2025 OnCon Icon Awards** (CISO Leadership), and prior nominations such as the **GoldenGov: State Executive of the Year** (2016).

These recognitions also underscore the leadership contributions of the County's Information Security Office, which continues to guide regional and statewide cybersecurity efforts. Team members represent Fairfax County on major intergovernmental bodies, including the **Commonwealth of Virginia's Cybersecurity Planning Committee**, the **ELECT Election Security Committee**, and regional initiatives coordinated through the **Northern Virginia Regional Commission**.

Fairfax County remains committed to advancing cybersecurity excellence through shared innovation, collaboration, and leadership that benefits both local communities and the broader public sector.

HIGHLIGHTS AND ACCOMPLISHMENTS FROM FY 2025

- ✓ Implemented Managed Defense/Incident Response Retainer service into program.
- ✓ Held Annual Security Awareness Day with approximately 300 attendees.

PLANNED DELIVERABLES FOR FY 2026

- Enhance enterprise cloud governance and protection.
- Complete Operational Technology Security Assessment of critical infrastructure.

3.7 ENTERPRISE RESOURCE PLANNING

FOCUS is Fairfax's SAP based enterprise resource planning (ERP) system shared by Fairfax County Government and Fairfax County Public Schools to conduct finance, budget, procurement, and human resources business functions. The FOCUS system was implemented in 2011/2012 to replace the county's legacy financial, procurement and human resources systems.

The implementation of the FOCUS project allowed for more efficient processes while seeking to mitigate the risk that antiquated and disjointed systems posed for system failure and inferior data. Automation and modernization empowered both employees and managers to execute processes more efficiently, and make the best strategic decisions based on the most timely and accurate information. This shifted the orientation of the system from that of a data repository to one of an information system solution. With the migration to a more standard, supportable database and development environment that incorporates workflow and Web technology, the project:

- ✓ Created a contemporary enterprise scale single solution platform that reduces total cost of system management and data center operations.
- ✓ Enabled a flexible environment where access to data and information is achievable, even from remote locations.
- ✓ Provided seamless integration and interoperability of the new system with other existing applications.
- ✓ Reduced the number of shadow systems currently used in the County and Schools that augment legacy system data and the associated reconciliation processes between systems.
- ✓ Aligned the reporting strategy with the County and School system's overall data management and data warehousing strategy to support increased intuitive reporting, better data definition, and analytics as well as data stewardship, integrity, and security. Improved the quality and accessibility of information for decision support and transparency.
- ✓ Facilitated modern and fully integrated best business practices that empowered agencies and employees to improve their productivity.
- ✓ Enhanced and improved functionality in back-office functional areas.
- ✓ Reduced redundant data entry, storage, and paper processing.
- ✓ Facilitated employee/manager self-service and procurement self-service via a web-based interface.

The FOCUS system is supported by the DIT FOCUS DevOps team and the DMB FOCUS Business Support Group (FBSG). The FOCUS DevOps is a team of highly skilled software engineers providing mission critical support for the FOCUS enterprise system including custom development, infrastructure support, identity management, business intelligence/report, portal support, end user provisioning and change management. The FOCUS Business Support Group (FBSG) is a team of business analysts providing functional system support to our business process owners and user community by providing expertise in business process design, requirements gathering, system solution design, system configuration and administration, report/data warehousing, and user support. The FBSG works in concert with the DevOps team to provide comprehensive, end-to-end system support.

The following 10 FOCUS guiding principles continue to shape how DIT plans and executes continued improvements and modernization activities:

1. Team Fairfax
2. One business system
3. Processes that fit the software
4. Efficiencies through integration
5. Increase capacity to excel and provide maximum value
6. Eliminate silos
7. Seek input and ideas
8. Change is good
9. Supported and sustained training
10. Failure is not an option!

Along with providing regular production support to our business process owners and user community, the collective FOCUS support team's mission is to continue to provide process improvement and system enhancements while ensuring the technical infrastructure is kept up to date with the latest technologies. Since FOCUS went live more than a decade ago, multiple projects have been completed to support this mission including annual stack upgrades, a major enhancement pack upgrade, a hardware/software upgrade, the implementation of Vendor Invoice Management, and a database upgrade to SAP HANA.

The future roadmap includes a user interface upgrade to SAP Fiori and eventually the move to SAP's newer applications such as S/4HANA, SuccessFactors, and Ariba.

ENHANCING USER EXPERIENCE: FOCUS'S UX STRATEGY

This entails an improvement in the overall experience with FOCUS by implementing a user centric UX strategy that focuses on simplicity, intuitiveness, and personalization. FOCUS UX initiatives are aimed at improving user engagement and ensuring that users can navigate the system seamlessly. By prioritizing simplicity, FOCUS team aims to reduce complexity and make it easier for users to interact with the platform. Intuitiveness is another key aspect of the strategy, as users should be able to easily understand how to perform tasks without needing extensive training or support. Implementation of personalization allows users to tailor their experience based on their preferences and specific needs.

FOCUS UX initiatives include redesigning the interface to enhance usability and accessibility, introducing features such as role-based dashboards and personalized recommendations to provide users with relevant information in a more efficient manner. Additionally, the project has focused on responsive design, making sure that the platform works seamlessly across different devices.

By implementing a user centric UX strategy, FOCUS aims to create an intuitive and personalized experience that simplifies complex processes and enhances overall efficiency.

HIGHLIGHTS AND ACCOMPLISHMENTS FROM FY 2025

- ✓ Integrated various modules and streamlined business processes.
- ✓ Automated workflows resulting in reduced manual data entry and errors.
- ✓ Ensured employees receive their salaries and wages accurately on schedule and adherence to local, state, and federal regulations related to payroll.
- ✓ Seamless integration with HR, finance, and accounting modules.
- ✓ Ensuring County Bond rating stays AAA+ by ensuring timely payments to Government Bonds.

PLANNED DELIVERABLES FOR FY 2026

- Upgrade UI framework for ESS/MSS.
- Modernize the BI reporting framework.
- Implement a new Identity Access Management Solution.
- Kickoff the Travel and Expense management Project.
- Plan the migration of SAP On Prem to Integration suite on the cloud.

3.8 PLANNING AND LAND USE SYSTEM MODERNIZATION

The departments supporting Fairfax County's land planning and development processes initiated a major strategic initiative, Planning and Land Use System (PLUS), to improve the speed, consistency, and predictability of the development review processes, and improve access to data and reporting. This project replaced and consolidated numerous legacy land use systems supporting zoning and development plan review, building permit/license issuance, code enforcement inspection, and cashiering activities. These legacy systems lacked the native agility of modern technologies for a flexible enterprise platform for evolving business process and architecture requirements, lacked optimal security capacities, and had compatibility issues with emerging desktop, tablet and mobile wireless technologies.

The initiative supports County plans to advance economic development and competitiveness, enhance business processes, provide better customer service, and achieve increased reliability in plan review, approval, permitting, and inspections. This initiative also supports Fairfax First and Economic Success strategies and aligns with the Board of Supervisors public engagement.

The PLUS Modernization initiative and associated projects implemented the best fit IT solution to meet the overall objectives for business functionality, customer service, and technology needs of County departments involved in the regulatory land use and development processes and to modernize and enhance the County's land use business architecture and its underlying technologies. PLUS replaced legacy systems that operated on obsolete technology architectures, and numerous complimentary systems with custom interfaces that were developed to meet evolving business

requirements over the past two decades. The legacy systems could not be modified to holistically accommodate the rapidly increasing changes in land planning and development business processes.

The PLUS project replaced and consolidated these aging systems with a modern technology platform driven by re-engineered, streamlined, and integrated business processes across the five major land use stakeholder agencies. This project worked with the ongoing Electronic Plan Submission Project (ePlans) to deliver technical integration and functional interoperability. Key features and accomplishments include:

- Executive sponsorship and governance by the Deputy County Executives for Land Development and Information, and a Senior Executive Steering Committee comprised of the Chief Technology Officer, IT Program Directors for Solutions and Land Development, GIS and Web in DIT, and agency directors of the five major agencies associated with the land use process. This group provided leadership and strategic direction for the project including goals, timeframes, and priorities.
- Key leadership for the business scope and process improvement opportunities and goals provided by the Department of Planning and Development (DPD) and Land Development Services (LDS). Other core stakeholder departments include Fire and Rescue – Fire Prevention (FRD), the Health Department – Environmental Health (HD), and Department of Code Compliance (DCC).
- County staff conducted independent assessments of current procedures and processes, benchmarking the County against other best practices, identifying opportunities for improvement, obtaining input from the development community, developing recommendations to improve services and operational execution and performed an in-depth market scan for solutions.
- An agile development approach for the PLUS system was adopted to deliver the software on an incremental basis, and continuously improve with end-user feedback to ensure the system meets current business needs. The software platform was upgraded to the most current version.
 - ◆ Release 1 was successfully launched in the second quarter of FY 2021.
 - ◆ The PLUS Project Roadmap was updated in the fourth quarter of FY 2021.
 - ◆ Release 2 was successfully launched in the first quarter of FY 2022.
 - ◆ Release 3 was successfully launched in the third quarter of FY 2022.
 - ◆ Knowledge Transfer sessions from vendor to County staff took place in the fourth quarter of FY 2022.
 - ◆ Release 4 was launched in the second quarter of FY 2023.
 - ◆ Project completion successfully achieved in FY 2023.
 - ◆ PLUS post-production stabilization is in progress which includes the migration to SaaS platform and is targeted to be completed in FY 2025.

The Department of Information Technology provided the technological leadership and worked closely with the above core departments to modernize and replace most of the legacy systems and supporting system silos that support land planning and development, inspections, code compliance processes, and provides contemporary capabilities for Web, mobility, and data analytics.

HIGHLIGHTS AND ACCOMPLISHMENTS FROM FY 2025

- ✓ Consolidated and fully Integrated PLUS System
- ✓ Modern System with upskilled County Staff
- ✓ Transition to a Digital Plan and Application submission and distribution
- ✓ Centralized System for internal & external agency review & comments.
- ✓ Realized benefits include reduction in paper, greater transparency, and real-time tracking and updates.
- ✓ User Friendly for Industry and Residents.
- ✓ GIS integration.

PLANNED DELIVERABLES FOR FY 2026

- Successful migration of PLUS workloads from on-prem to Accela SaaS.
- Overall business functionality including Interfaces and Reports is thoroughly tested and signed off before cutover to SaaS
- Perform SaaS User Acceptance Test with full data and document load to ensure performance is on par with on-prem
- Knowledge transfer from vendor to county staff to run operations on SaaS

3.9 INFRASTRUCTURE AND PLATFORM SERVICES

The Infrastructure & Platform Services program supports Fairfax County's goal of an always-on, secure, and modern government enterprise. It delivers foundational technology capabilities while ensuring staff can work from anywhere using secure, scalable tools. Key focus areas include platform stability, centralized enterprise services, and seamless access for all users:

DIT's strategic direction & market forces influences our platform strategy and is shaped by three primary market trends:

- Cloud Adoption & Evolving Technologies – Promoting a SaaS-first and software-defined model.
- Staffing & Funding Constraints – Prioritizing simplified architectures with minimal operational overhead.
- Security Threat Evolution – Move to Zero Trust security models with assumed breach readiness.

The County manages a hybrid ecosystem of applications in support of the following application delivery/hosting models:

- On-premise systems hosted on physical or virtual machines
- Vendor-managed solutions, both on and off-premises
- SaaS/PaaS/IaaS platforms like Microsoft 365, ServiceNow, and VMware
- Public cloud services (AWS, Azure, Oracle)

The program emphasizes private cloud use, shifting to SaaS/PaaS/IaaS wherever possible and software-defined solutions when required. This approach balances cost, flexibility, and long-term sustainability.

Talent, Simplicity & Operational Efficiency: With IT projects largely funded through capital or grant-based investments, post-project staffing must remain minimal. Simplifying platforms and processes helps existing staff manage broader responsibilities efficiently. Recruiting and retaining top IT talent remains vital.

Security-Driven Frameworks: The infrastructure team embraces Zero Trust as a core security model, integrating with network and application security practices. A SaaS-based Zero Trust platform enhances adaptability and protection against next-gen threats while supporting BYOD, remote access, and evolving entitlements.

HIGHLIGHTS AND ACCOMPLISHMENTS FROM FY 2025

- ✓ Cloud & Platform Modernization
 - ◆ Disaster recovery upgrades and failover automation across data centers
 - ◆ Backend application isolation and segmentation for Zero Trust
 - ◆ Software-defined load balancing for cost savings and scalability
 - ◆ Advanced intrusion detection and prevention tools
- ✓ Remote Work & Zero Trust Access
 - ◆ Legacy VPNs were replaced by a modern Private Access solution. This platform enables secure remote and in-office access, supports Zero Trust practices, and scales efficiently for future expansion.
- ✓ Resiliency & Continuous Operations New projects enhanced disaster recovery, ransomware readiness, and infrastructure optimization:
 - ◆ Incident response upgrades and data classification tools
 - ◆ Automated application failover between County facilities
 - ◆ Data center space, power, and platform consolidation
- ✓ Unified Communications & Citizen Services The County modernized its communications platforms:
 - ◆ Teams Voice Transition – Replaced legacy systems with Microsoft Teams
 - ◆ IVR Modernization – Improved citizen experience, introduced SMS capabilities, and CRM integration
 - ◆ 311 Transformation – AI-powered chatbots (Zammo) provide 24/7 assistance and improved accessibility

PLANNED DELIVERABLES FOR FY 2026

- Voicemail Unification – Centralized voicemail with email delivery
- Call Recording Modernization – Enhances quality, reduces costs, and adds analytics for sensitive communications
- Unified Monitoring – Single dashboard for all telephony systems
- Additional planned enhancements in the application modernization & containerization efforts with a focus on increasing agility:
 - ◆ Monitoring Portals – Allow application owners to track usage and troubleshoot issues independently
 - ◆ Container Adoption – Lightweight, portable microservices support scalable and resilient application development
 - ◆ Root Cause Analysis Tools – Improves visibility into performance issues and service impacts

The Infrastructure & Platform Services team continues to deliver cost-efficient, secure, and user-friendly technology platforms that support County operations and citizen services. Through simplification, Zero Trust integration, and cloud-forward modernization, Fairfax County remains agile and prepared for future challenges.

3.10 BUSINESS APPLICATIONS

The Business Applications division manages and administers important technologies that support a variety of business areas and processes across all County agencies. This team ensures applications can be rapidly created, and that business data is readily available to support county initiatives. Technologies, including customer relationship management, business process automation, and low code artificial intelligence solutions, are designed and deployed by this team to enhance organizational operations and processes, to improve efficiency. This allows both staff and citizens access to modern applications and technology that enable access to government services. As the need for real time information and seamless interaction with government services continues to grow dramatically, agencies and business units must leverage technology to quickly provide information to the public while capturing meaningful data such as constituent interactions and responses to inquiries. This team works closely with various County business areas to understand what technology needs will empower them to serve the community with efficiency and support a seamless county experience.

The Business applications team, not only develops in cloud native platforms but provide standards and review of vendors developing within the County enterprise Power Platform or Dynamics tenant. Rigorous standards and best practices are required to be followed to ensure the security, maintainability, and scalability of these applications.

The standards, governance, and subject matter expertise this team provides for low code application development enables both professional developers and technically savvy County employees to leverage technology to meet changing needs. This team works across DIT areas and agencies to administer and provide tools, in a common platform that keeps county data secure in enterprise County systems. The business applications team promotes agile development practices that maximize time to value for software solutions and systems. This division promotes effective and efficient government by integrating with a robust set of cloud services and uses an API first approach to support seamless and secure data exchange to improve both internal and external customer experiences.

This division aligns with the Countywide strategic plan and supports the replacement of several customer-facing applications/solutions with more advanced applications to improve internal efficiency and ensure equitable access. This division also focuses on legacy modernization and has successfully completed data conversion, migration, and implementation of a variety of applications now stored in the County's enterprise. Applications and solutions have been deployed to support the coordination of county teams investigating illicit message, to modernize the Continuity of Operations Planning process, and to support the legislative review process. With an enterprise oversight role, this division has ensured the success of multiple other projects partnering with Unified Communications, Health and Human Services and the Revenue Services Branches. Business applications will continue to plan and execute migrations from legacy systems to meet the County's digital transformation and cloud goals as well as supporting the County's strategic initiatives. Ultimately the efforts, technology solutions and work aligned into the Business Applications division aims to modernize and eliminate redundant systems, providing tangible evidence to citizens that their government is efficiently working to provide better user experiences, data, access to information, and improved accountability/compliance.

HIGHLIGHTS AND ACCOMPLISHMENTS FROM FY 2025

- ✓ The Business Applications team completed review of over 100 application changes for compliance with County standards, averaging 8-9 reviews each month.

Row Labels	Reviews
First time code review - Initial Application Review	19
Follow up code review - Changes and Fixes	12
Post UAT - Changes and Fixes	27
Post Production - Major changes	8
Post Production - Minor changes	37
TOTAL	103

PLANNED DELIVERABLES FOR FY 2026

In FY 2026 the Business Application Team plans to enhance several applications in production and complete several sprints to enhance internal and external customer experiences. Planned activity for FY 2026 include:

- Enhancements and new automations for the Department of Management and Budget (DMB) annual budget process
- Continued refinements for the various board of supervisor CRM configurations
- Release of Rezoning affidavit to public website for streamlined and enhanced efficiency when submitting rezoning affidavits
- Phase II of the Juvenile and Domestic Relations District Court Intake Clearing house solution
- Updated Aquire intake for Department of Procurement and Materials management and integrations with service now
- Continued support to modernize other legacy systems such as access databases and application code review and vendor management

3.11 DATA ARCHITECTURE AND ANALYTICS

At the core of operations, data is a key enabler for delivery of high-quality services by providing actionable insights to the organization and the public in Fairfax County. Data architecture and analytics is a strategic initiative to position the county to best use technology to harness the power of data to improve processes, support digital transformation, facilitate improved decision making, and to continue building trust with the community. The department of information technology has a team that support the technical implementation of data analytics efforts, to include setting up architecture, performing analytic tasks, developing data products as well as providing subject matter expertise to agencies and other stakeholders. This program ensures the County's ability to use data, by establishing and maintaining critical foundational components such as:

- A data analytic infrastructure that leverages both private and commercial cloud technologies that drive innovation and scalability.
- A technical framework and governance of technologies to support business intelligence and analytical insights.
- Adoption of a standardized framework to ensure standards and protocols are in place to maximize data value.
- Automation capabilities to streamline data processing and analysis.

As the data analytics project supports technical efforts to ensure maximum value from the County's data to drive efficiencies and the goals of the strategic plan, it is integral there is a deep connection to the business area objectives. This project focuses on technical areas like enabling technical processes and frameworks to ensure accuracy, privacy, and security across the enterprise.

Implementation and participating in enterprise data classification efforts along side cybersecurity, business areas and the archives team.

Aligned with DIT's architecture this strategic area is focused on ensuring county staff and residents know that data is used for making a better government through analytical insights and data products that are focused on the following:

- ✓ Facilitate better data driven decisions
 - ◆ Use public input and data to anticipate challenges and opportunities.
 - ◆ Find innovative ways to provide equitable and meaningful services for the community.
 - ◆ Highlight disparities within a geographical area and distribute resources equitably through targeted intervention.
- ✓ Build trust with residents through transparency
 - ◆ Provide residents control over personal data through an intuitive portal and increased visibility about how data is used.
 - ◆ Provide effective data management so residents can select data privacy levels and update personal information when needed.
 - ◆ Demonstrate positive community outcomes achieved by utilizing resident data for analytical analysis.

Ultimately, the goal of this strategic initiative is to enable the County to be a data driven organization that uses data to underpin policy, decisions, and actions to improve services and outcomes for residents, businesses, and the County. Leveraging technology methods, practices and tools to support the county's ability to evaluate and monitor performance while helping plan and prepare for the future, predicting issues before they arise. Empowering a data driven organization through technology ultimately supports delivery of high-quality services, operational and county-wide strategic objectives and focuses on community outcomes and benefits.

HIGHLIGHTS AND ACCOMPLISHMENTS FROM FY 2025

- ✓ With the emerging needs for the county to realize efficiencies leveraging technology like Artificial Intelligence, good data practices are incredibly important. In FY 2025, this project supported the establishment of a secure large language model, and the baseline architecture to scale additional AI solutions for the enterprise.
- ✓ The data analytics team worked agilely to release two versions of the internal Fairfax chat assistant, this allows general inquiries, summarization, and idea generation, to include uploading of documents, but not image generation. Successfully completed proof of concept work with a cloud data platform to ingest data from a variety of sources to establish some baseline master data management strategies.

PLANNED DELIVERABLES FOR FY 2026

- In FY 2026 work will continue to add AI solutions that help employee efficiency, this includes releasing, several specific use cases with industry leading AI technologies for enhanced productivity.
- Several departmental AI use cases will be piloted for large business areas, such as solutions to support the department of family services and the health department.
- Data analytics work will continue with data lake housing efforts for several agencies to include (but not limited to) Park Authority, Health Department, and the countywide data analytics team.
- Lastly in FY 2026, the team will refine and iterate on the cloud architecture that supports AI and Data solutions, ensuring the scalability and security of the cloud resources.

3.12 ENTERPRISE CONTENT AND DOCUMENT MANAGEMENT

The County established a strategic approach to content and document management by developing an integrated solution on an enterprise platform. Content Management is part of an organization's foundation for the use of information from structured data (through business applications), and unstructured data in electronic or imaged documents (word processing documents, spreadsheets, e-mail, and reports).

The County's Content Services Platform (CSP) integrates with Cloud infrastructure and is deployed in containers that allows for full portability of data between County private cloud, public cloud, and on-premises platforms. Artificial intelligence can also be utilized for tasks like assigning metadata and even recommending document organizational improvements, and automatically categorizing content based on predefined terms and taxonomies, which allows AI to work at a scale and speed that improve business processes almost instantaneously. This comprehensive approach and associated implementation of technology provides a familiar search engine-like interface for rapid information retrieval. This platform can also integrate with low-code development tools and empower business users to build applications in hours that used to require months of software engineering. CSP APIs enable connections to preferred workflow, collaboration, business intelligence and analytical tools to minimize complexity and training needs, avoid custom software development, and add functionality with a building block approach. This integrated solution is more cost-effective and provides a seamless integration for use of information exchange and data sharing with other systems required for a complex business transaction.

Content, records, and document management will continue to be a long-term strategy for integration of structured and unstructured electronic and paper-based information and file types to optimize and enhance overall information management, transparency, and decision processes. These initiatives have provided benefits and quality improvements including:

DIT PROGRAM AREAS

- Increased staff productivity through the delivery of the right documents at the right time.
- Enhanced communication and collaboration through shared information.
- Improved speed of information and transaction flow throughout County agencies.
- Improved access and security through controlled access to sensitive documents.
- Reduced time spent searching for critical documents.
- Improved disaster recovery through electronic storage and backup of information that is far more secure than paper.
- Reduced clerical, paper, printing, and storage costs.

HIGHLIGHTS AND ACCOMPLISHMENTS FROM FY 2025

- ✓ Cloud Storage Migration: Successfully migrated storage to the cloud, enhancing data accessibility and security.
- ✓ OpenText Implementations:
 - ♦ DTA Tax Relief: Implemented OpenText solution to streamline tax relief processes and improved data management.
 - ♦ Animal Shelter Agency: Completed a proof of concept for OpenText implementation, demonstrating potential for improved document management and community services.
 - ♦ Housing Community Development: Expanded OpenText solution to finance and homeownership divisions, driving efficiency and productivity.
 - ♦ DFS: Providing Ongoing maintenance and support ensuring seamless functionality. Adding additional features to application to enhance functionality and user experience.
- ✓ Community Development: Continued community development initiatives, fostering growth and engagement.

PLANNED DELIVERABLES FOR FY 2026

- Upgrade SQL Server 2022 and Windows Servers 2025
 - ♦ Assess current infrastructure
 - ♦ Plan and execute upgrades
 - ♦ Test and validate functionality
- Upgrade OpenText 24.4
 - ♦ Assess current OpenText environment
 - ♦ Plan and execute upgrade
 - ♦ Test and validate functionality
- Implement Records Management Solution
 - ♦ Configure RM classifications
 - ♦ Set up retentions and disposition policies
 - ♦ Train Archive Team and Records Managers
- Implement Governance Model
 - ♦ Develop content repository management policies
 - ♦ Establish procedures for content management

3.13 COURTS TECHNOLOGY OFFICE

The Court Technology Office (CrTO) coordinates research and facilitates automation and technological enhancements throughout the court system; to include:

- Circuit Court & Records
- General District Court
- Juvenile and Domestic Relations District Court
- Office of the Commonwealth's Attorney
- Office of the Sheriff
- Police
- Fairfax Bar Association
- Fairfax Law Library

Substantial opportunities exist by centralizing courtroom technology between the three courts and sharing resources and infrastructure. The CrTO was created to provide a means of developing, coordinating and implementing courtroom technology and automated information systems to improve and streamline court management and operations for the 41-courtroom facility and related support offices and programs. The CrTO is a Program area of the Department of Information Technology supporting all three Courts under the direction of the Chief Judge, Clerk of the Court and the Fairfax County Chief Information Officer.

PROGRAM OVERVIEW

- At the highest level, the CrTO is focused on the integration and implementation of cutting-edge technology in the courtroom environment. Our initiative aims to modernize the Fairfax County Courthouse, ensuring it meets contemporary industry standards and future technological requirements. Key projects under the Courtroom Technology Management Systems (CTMS) program align with Fairfax County's strategic objectives of improving citizen access to the courts, facilitating efficient trials and hearings, and providing adaptable solutions for future technological advancements.

Judge's Control Screen CTMS

Key initiatives and projects at the Fairfax County Courts Technology Office include several technological advancements. The Digital Upgrade of Courtrooms Technology (CTMS project) aims to modernize courtrooms, conference rooms, and jury spaces with the latest audiovisual technology, including BYOD capabilities, HDMI connectivity, Wi-Fi access, annotation enhancements, upgraded touch panels, and network-managed video services. This has led to a 99% increase in technology usage and an 85% reduction in technical issues during trials.

Also, the CrTO plays an essential role in modernizing court services and improving public access to justice through the development and oversight of home-grown applications. The CrTO program with the help of other DIT program areas has delivered tailored solution that addresses the unique needs of the court system, services and the community it serves.

HIGHLIGHTS AND ACCOMPLISHMENTS FROM FY 2025

- ✓ Full Implementation of Digital Upgrade of One General District Courtroom (1A)
- ✓ Upgrade and Migration of Courtroom Digital Audio Recording to an Established Cloud Platform Including Speech-to-Text Capabilities.
